Opinion
SUMMARY RATING RATIONALE

Moody's assigns a bank financial strength rating (BFSR) of D- to Hypo-Alpe-Adria-Bank International AG (HAA), which is equivalent to a baseline credit assessment of Ba3. While the bank's financial profile is satisfactory, the D-BFSR reflects our concern regarding HAA's corporate governance and risk management which, in Moody's view, are well below industry best practice, as well as the heightened business and financial risks associated with the bank's rapid expansion in South-eastern Europe.

HAA's long term global local currency (GLC) deposit rating is at the A2 level. The rating is underpinned by (i) the baseline risk assessment of Ba3; (ii) our assessment of the high probability of support from the Austrian Federal State of Carinthia; and (iii) our expectation of systemic support in the event of a crisis.

HAA's debt rating is A2. The debt rating for grandfathered obligations which continue to benefit from deficiency guarantees from the Austrian Federal State of Carinthia is Aa2, reflecting the financial strength of the guarantor.

Credit Strengths

- Strong implicit support from the Austrian Federal State of Carinthia. The benefits of the explicit deficiency guarantee from the Austrian Federal State of Carinthia are not applicable to new senior obligations, but the bulk of HAA's debt is grandfathered
- Good regional retail and SME banking franchise in Carinthia with resilient market shares, and an important economic role in Carinthia
- Valuable South-eastern European banking network which spans much of the Balkan states, as well as northern Italy
- Satisfactory financial flexibility

Credit Challenges

- Tarnished reputation following substantial treasury losses in 2004, which came to light belatedly during 2006
- Corporate governance and risk management remain well below industry best practice
- Rapid growth in South-eastern Europe requires ongoing improvements in operating and monitoring infrastructure
- Revenues and earnings increasingly dependent on South-eastern European operations, which entail materially higher business, financial and political risks as well as possible negative repercussions for the asset quality and earnings of the bank
- Deficiency guarantee is not available for future obligations
- Implicit support could diminish as the State of Carinthia has reduced its indirect stake in HAA to 44.91% in advance of the public listing envisaged for 2008 or later

Rating Outlook

The outlook for the D- BFSR is stable and the low level reflects Moody's view that material improvements in corporate governance and risk management may only be achieved over the medium term. Likewise, the outlooks for HAA's other ratings is also stable. These include the A2 long-term rating for the bank's senior unsecured obligations, the Baa2 rating for junior subordinated securities, the Aa2 rating for obligations which qualify for grandfathering, as well as the short-term P-1 rating.

What Could Change the Rating - Up

Any upgrade of the D- BFSR would necessitate further progress towards an improved risk management framework and stronger corporate governance. At present, corporate governance at HAA remains well short of market best practices. Further considerations include better alignment of risk appetite and improvements in quality of earnings and capital, as well as improvements in asset quality and reserve coverage.

An upgrade of HAA's A2 rating, or the Baa2 rating for its junior securities, could be triggered by (i) an improvement in Hypo-Alpe-Adria-Bank's BFSR; (ii) strengthening in the credit quality of the State of Carinthia and its commitment to HAA; and/or (iii) a change in ownership which would offer additional financial or franchise strength. Any change in the backed Aa2 rating for obligations which benefit from grandfathered deficiency guarantees would be directly linked to changes in the financial assessment of the Austrian Federal State of Carinthia.

What Could Change the Rating - Down

Failure to make further progress in corporate governance and risk management, or evidence of weakness with regard to implementing a stronger risk culture, could create downward pressure on the BFSR. Likewise, deterioration in any of the bank's current qualitative and quantitative factors - particularly asset quality, earnings or overall risk profile - could result in negative rating pressure. In this regard, we highlight the risks associated with HAA's rapid expansion in South-eastern Europe.

A downgrade of HAA's LT local currency deposit rating could be triggered by (i) a change in HAA's baseline rating; (ii) a change in the implicit support expected from the Austrian Federal State of Carinthia or a deterioration in the state's creditworthiness; and/or (iii) a negative change in expected systemic support.

Recent Results and Developments

For the full year 2006, HAA reported group net income of EUR 71.7million (2005: EUR 142 million) on year-end total assets of EUR 30.6 billion (year-end 2005: EUR 24.2 billion). The Austrian State of Carinthia reduced its indirect stake in HAA to 44.91% in conjunction with the EUR 250 million capital increase in February 2007 and the public listing envisaged for 2008 or later.

DETAILED RATING CONSIDERATIONS

Detailed rating considerations for HAA's currently assigned ratings are as follows:

Bank Financial Strength Rating

Moody's assigns a D- BFSR to HAA, versus the D outcome generated by our bank financial strength rating scorecard. Moody's believes the D- rating is a more appropriate measure of the bank's financial strength given our concern regarding weaknesses in HAA's corporate governance and risk management practices, the satisfactory levels of the bank's financials and the ongoing risks associated with HAA's expansion in South-eastern Europe.

Qualitative Rating Factors (50%)

Factor 1: Franchise Value

Trend: Neutral

Although based in Austria, HAA's franchise broadly spans the main banking markets of South-eastern Europe. Domestically, HAA has a good regional retail and SME banking franchise in Carinthia with resilient local market shares, including market leadership in institutional and public-sector related business. HAA has become a regional leader in terms of leasing activities and has established profitable banking operations across the region, including meaningful franchises in northern Italy, Slovenia, Croatia, Bosnia and Serbia.

The overall score for franchise value is C-.

Factor 2: Risk Positioning

Trend: Neutral

Moody's remains concerned that HAA's corporate governance and risk management remain well below industry best practice. During 2006, HAA announced that its treasury activities from 2004 resulted in significant losses and an erosion of the bank's then capital to levels which breached capital adequacy requirements. These losses only came to light during 2006. This followed a decision by HAA's international auditor to revoke certification of the bank's 2004 accounts and to call into question the liberal accounting approach originally taken by the local auditors and the HAA boards, which had enabled the losses to be concealed.

During 2006, Moody's commented that these events revealed not only weaknesses in the bank's risk management framework, including risk culture, measurement and systems, but also a lack of transparency and rigour in the bank's handling of developments once the details of the transactions became known. HAA's strong expansion into countries with less developed legal and risk infrastructures than those in Austria further underscores the importance for HAA to have robust risk management practices, covering risk governance and culture, management, measurement and systems. In light of developments in 2006, HAA made significant changes to the composition of its management and supervisory boards, yet these fell short of a wholesale exit of all board members collectively responsible. Likewise, HAA has made some progress to date in introducing improved risk management systems and procedures. The impact of the improvement in risk infrastructure should be felt in the near term, however by its nature the establishment of a more robust risk culture is more time consuming and its outcome uncertain. A successful track record will need to be demonstrated for Moody's to factor in these changes in its assessment.

With regard to transparency, the planned publication of IFRS reporting by HAA for year-end 2007 should result in improved financial disclosure and transparency. We note that credit concentrations in terms of both borrowers and industries may pose a threat to the bank's overall credit quality, particularly due to the significant level of leasing and real estate based lending outside of Austria. Up to end-March 2007, HAA took advantage of its backed Aa2 ratings in order to ensure strong liquidity via pre-funding. Reported market risk appetite has also been reduced materially.

The overall score for risk positioning is E.

Factor 3: Regulatory Environment

All Austrian banks are subject to the same score on the regulatory environment. This factor does not address bank-specific issues; instead, it evaluates whether or not regulatory bodies are independent and credible, demonstrate enforcement powers and adhere to global standards of best practices for risk control.

Factor 4: Operating Environment

Trend: Neutral

HAA's home market of Austria receives an A- score for its operating environment and benefits from the established Austrian legal and business practices. However, much of HAA's operations lie outside of Austria in the less developed markets of South-eastern Europe; these include Bosnia, Serbia and Croatia. We use a weighted average of the operating environment score of each country in which HAA operates, with the weights based on operating profit allocated to each respective country.

HAA's operating environment is scored as D.

Quantitative Rating Factors (50%)

Factor 5: Profitability

Trend: Neutral

Profits from growth markets such as Croatia and Serbia, combined with earnings from HAA's leading franchises in related financial activities such as leasing, continue to help to offset lacklustre profits in HAA's domestic market. Indeed, HAA's expanding franchise in South-eastern Europe offers the prospect of future earnings growth, though offset by ongoing investment in expansion and the potential for higher operational and credit risks than those in Austria. Nonetheless, we expect that profitability may well improve, and should benefit from the bank's further diversification of revenues to include a higher share of non-interest income. Overall, however, we expect a neutral view for the score, incorporating our concerns regarding potential business and operational costs in HAA's markets - particularly outside of Austria.

The D+ score reflects Moody's view on the bank's profitability.

Factor 6: Liquidity

Trend: Neutral

HAA enjoys a solid liquidity position, which has benefited in part by prudent pre-funding under HAA's backed Aa2 rating. Although the deficiency guarantee which underpinned the higher rating is no longer available for obligations generated from 1 April 2007, HAA has maintained an ample liquidity profile. Liquidity management practices are appropriate, as underscored by both the qualitative assessment and the profile of the bank's financials.

The C score reflects Moody's view on the bank's liquidity.

Factor 7: Capital Adequacy

Trend: Improving

Although HAA's capital base for year-end 2004 failed to meet regulatory requirements in the re-stated financial statements, HAA's profitability and subsequent capital increases have helped to rebuild adequate capitalisation. Significant further strengthening of capital adequacy is expected via retained earnings from 2006 results to levels which we expect will be more commensurate with the risk profile of the bank. A track record of maintaining significantly higher capital levels could result in upward pressure on this score.

The D score reflects Moody's view on the bank's capital adequacy.

Factor 8: Efficiency

Trend: Neutral

HAA's efficiency scores are strong and reflect the bank's increasing share of non-interest income from services, as well as HAA's strength in leasing activities, and measures to keep its cost base under control. Although we expect future costs may well increase due to investment and expansion, the current cost-income ratio is very competitive relative to that of peers and lies at the extreme high end of the range for the C score.

The C score reflects Moody's view on the bank's efficiency.

Factor 9: Asset Quality

Trend: Neutral

The overall level of non-performing loans reflects HAA's business profile and the bank's strong expansion into markets in South-eastern Europe. This has contributed to a moderate level of problem lending. Our evaluation of asset quality also incorporates the bank's levels of available capital. As such, should HAA's capitalisation strengthen materially more than expected, there could be positive pressure on this metric.

The D score reflects Moody's view on the bank's asset quality.

Global Local Currency Deposit Rating (Joint Default Analysis)

Moody's assigns a global local currency deposit rating of A2 for HAA. The rating is supported by HAA's baseline risk assessment of Ba3 (which translates from the BFSR of D-), and high levels of implicit support from the State of Carinthia, as well as systemic support.

Notching Considerations

Ratings for HAA's junior obligations issued via Hypo Alpe Adria (Jersey) Ltd. are rated at Baa2 and reflect a three-notch rating differential, in line with Moody's refined notching methodology published in April 2007.

ABOUT MOODY'S BANK RATINGS

Bank Financial Strength Rating

Moody's Bank Financial Strength Ratings (BFSRs) represent Moody's opinion of a bank's intrinsic safety and soundness and, as such, exclude certain external credit risks and credit support elements that are addressed by Moody's Bank Deposit Ratings. BFSRs do not take into account the probability that the bank will receive such external support, nor do they address risks arising from sovereign actions that may interfere with a bank's ability to honor its domestic or foreign currency obligations. Factors considered in the assignment of BFSRs include bank-specific elements such as financial fundamentals, franchise value, and business and asset diversification. Although BFSRs exclude the external factors specified above, they do take into account other risk factors in the bank's operating environment, including the strength and prospective performance of the economy, as well as the structure and relative fragility of the financial system, and the quality of banking regulation and supervision.

Global Local Currency Deposit Rating

A deposit rating, as an opinion of relative credit risk, incorporates the BFSR as well as Moody's opinion of any external support. Specifically, Moody's Bank Deposit Ratings are opinions of a bank's ability to repay punctually its deposit obligations. As such, they are intended to incorporate those aspects of credit risk relevant to the prospective payment performance of rated banks with respect to deposit obligations, which includes: intrinsic financial strength, sovereign transfer risk (in the case of foreign currency deposit ratings), and both implicit and explicit external support elements. Moody's Bank Deposit Ratings do not take into account the benefit of deposit insurance schemes which make payments to depositors, but they do recognize the potential support from schemes that may provide assistance to banks directly.

According to Moody's joint default analysis (JDA) methodology, the global local currency deposit rating of a bank is determined by the incorporation of external elements of support into the bank's Baseline Risk Assessment. In calculating the Global Local Currency Deposit rating for a bank, the JDA methodology also factors in the rating of the support provider, in the form of the local currency deposit ceiling for a country, Moody's assessment of the probability of systemic support for the bank in the event of a stress situation and the degree of dependence between the issuer rating and the Local Currency Deposit Ceiling.

National Scale Rating

National scale ratings are intended primarily for use by domestic investors and are not comparable to Moody's globally applicable ratings; rather they address relative credit risk within a given country. A Aaa rating on Moody's National Scale indicates an issuer or issue with the strongest creditworthiness and the lowest likelihood of credit loss relative to other domestic issuers. National Scale Ratings, therefore, rank domestic issuers relative to each other and not relative to absolute default risks. National ratings isolate systemic risks; they do not address loss expectation associated with systemic events that could affect all issuers, even those that receive the highest ratings on the National Scale.

Foreign Currency Deposit Rating

Moody's ratings on foreign currency bank obligations derive from the bank's local currency rating for the same class of obligation. The implementation of JDA for banks can lead to high local currency ratings for certain banks, which could also produce high foreign currency ratings. Nevertheless, it should be noted that foreign currency deposit ratings are in all cases constrained by the country ceiling for foreign currency bank deposits. This may result in the assignment of a different, and typically lower, rating for the foreign currency deposits relative to the bank's rating for local currency obligations.

Foreign Currency Debt Rating

Foreign currency debt ratings are derived from the bank's local currency debt rating. In a similar way to foreign currency deposit ratings, foreign currency debt ratings may also be constrained by the country ceiling for foreign currency bonds and notes; however, in some cases the ratings on foreign currency debt obligations may be allowed to pierce the foreign currency ceiling. A particular mix of rating factors are taken into consideration in order to assess whether a foreign currency bond rating pierces the country ceiling. They include the issuer's global local currency rating, the foreign currency government bond rating, the country ceiling for bonds and the debt's eligibility to pierce that ceiling.

About Moody's Bank Financial Strength Scorecard

Moody's bank financial strength model (see scorecard below) is a strategic input in the assessment of the financial strength of a bank, used as a key tool by Moody's analysts to ensure consistency of approach across banks and regions. The model output and the individual scores are discussed in rating committees and may be adjusted up or down to reflect conditions specific to each rated entity.
